The komacv class*

Salome Södergran
salome.soedergran@gmx.ch

February 12, 2021

Abstract

The komacv class makes typesetting an attractive CV easy. While it comes with several predefined styles it is still highly customizable. Virtually all settings can be controlled by user commands.

1 Introduction

This class originates from an imitation of the moderncv class. Thanks to Xavier Danaux for that fine class! While komacv owes a lot to the original code, it does not pretend to be a precise copy and does not intend to keep up with the further development of the moderncv class. The original class was taken as an important starting point but it is likely that the further development will take different directions.

While moderncv is a stand-alone class, this one is a wrapper class building upon the KOMA-class scrartcl (hence the koma- in the name of this class). This gives users more flexibility as the page layout is easily adjustable and incompatibilities with other packages are less likely to occur. The incompatibility of the moderncv class with the biblatex package was actually the main reason for my building the predecessor of this class, the koma-moderncvclassic package. Compared with that package, this class offers much more flexibility and customizability, comes with a variety of styles and is extensible (new styles can be added easily).

With `\documentclass{komacv}` at the beginning of your document the commands and environments of both this class and the scrartcl class become available.

The variants of the file komacv_example which come with this package show exemplarily how a document with komacv might be structured and how the typical commands are to be used. They are not intended as examples of good style but as demonstrations of the potential of the komacv class. In this documentation all commands and features are explained.

As for typesetting a covering letter with komacv, see 8.

2 Engines

This class can be run with either XeTeX, XeLaTeX, LuaTeX, LuaLaTeXor pdfLaTeX. See also 3.7.

3 In the preamble

3.1 Documentclass options

komacv accepts the following key-value pairs as optional arguments of `\documentclass`:

`[xcolor=<value>]` The value of the key `xcolor` is passed to the xcolor package and takes the name of the color spectrum. These are the names of color spectra defined by xcolor: svgnames, dvipsnames, x11names. If the option is not set or the key `xcolor` is given without a value, then the default is used which is x11names.

`[color=<value>]` The value of the key `color` is the name of the color to be used in special elements of the document like section and subsection headers of the document (depending on the chosen style). The name is either a base color name (black, blue, green a. s. o.) or a color name according to the chosen color spectra defined by xcolor (e. g. Firebrick2 in x11names). See the xcolor documentation for a list of valid color names. Color definitions such as `red!75` or `blue!30!green` are also accepted. Yet another possibility is to specify `mycolor` in the preamble (see below). If the color option is given without an argument or not given at all,

`[color=mycolor]`

is assumed as default.

If `mycolor` was not defined, the fallback is `blue` instead of `mycolor`.

`[style=<value>]` This option loads the style variant. The default is `style=classic`. Other variants currently available are: `casual` and `oldstyle`. Other variants may follow in time, contributions are very welcome! See the example documents to see the different layouts the styles produce.

`[fontawesome=false]` In case you don't like the social media symbols offered by fontawesome or if fontawesome provides error messages you may turn off the use of fontawesome with this option. Please note that you don't have to use this option to avoid fontawesome; you may just redefine the social media symbols to your liking with `\renewcommand` (see 3.3).

`\KOMAoptions` In addition to these komacv specific options, all KOMA-options may be used as with the KOMA-classes. They may be given either in the option list of `\documentclass` or with the help of `\KOMAoptions` somewhere in the preamble:

`\documentclass[`⟨*key=value*⟩`]`{komacv} or

`\KOMAoptions{`⟨*key1=value1,key2=value2*⟩`}`

and will be passed to the scrartcl class (on which the komacv class is built).

3.2 Personal data (header and footer)

To specify your personal data set the macros with `\renewcommand`:

`\renewcommand*\`⟨*command*⟩`{`⟨*Definition*⟩`}`, *for example:*

`\renewcommand*\title{Curriculum vitae}`.

`\headline` With `\headline[`⟨*alignment*⟩`]{`⟨*type*⟩`}[`⟨*content*⟩`]` you can set – guess what? – a headline or title for the whole document, either a title (like "Curriculum vitae") or your name, which may come in handy if you have a very long name that is otherwise being displayed in an unsatisfying way. The first optional argument sets the alignment (`l`=left, `r`=right, `c`=centered (default)). The mandatory argument defines the type (`name` or `title`). The last optional argument defines the content of the headline. If it is ommitted, with type `name` firstname, lastname and (if defined) the academic title are used, with type `title` "Curriculum vitae". Apart from that, the only difference between the two types is that with type `title` the name is printed with the personal data, whereas it is ommitted with type `name` to avoid duplicates. Depending on the combination of style and type the result may be aesthetically questionable.

Example:

`\headline{name}` sets your defined firstname and familyname as a centered headline.

`\headline[r]{title}[Lebenslauf]` sets "Lebenslauf" as a right-aligned headline.

`\title` The macro `\title` sets nothing in the document itself but is for the pdf document properties only. Note that for this macro special characters (like German umlauts) must be given in the LaTeX notation (e. g. `\"a`) even if utf is enabled for the document.

`\firstname`
`\familyname`
`\mobile`
`\phonenr`
`\faxnr`
`\email`
`\homepage`
`\twitter`
`\github`
`\facebook`
`\linkedin`
`\acadtitle`
`\addressstreet`
`\addresscity`
`\extrainfo`
`\cvquote`

The macros listed beside, if specified, will be used in the head (or foot, depending on the style in use) of your CV. If there are elements you do not wish to appear in your CV just leave the corresponding macros undefined.

The names of the macros are self-explanatory, so I will give just a few hints.

`\acadtitle` expects your academic title(s). `\addressstreet` is for your street or P.O. Box, and `\addresscity` for your city, ZIP Code and possibly your country.

`\extrainfo` takes any arbitrary additional information and will appear at the end of the addressblock (depending on the chosen style).

Put your life motto (or something alike) into `\cvquote`. It will usually appear somewhat separated from the rest of the header.

See below (3.6 and 3.7) how to change the appearance of the information given in these macros.

The header and possibly footer are set with the command `\maketitle` at the beginning of the document.

If you want to create your own footer, define your own pagestyle and call it with `\thispagestyle{`⟨*mypagestyle*⟩`}` right after `\maketitle`. The command `\addtofooter[`⟨*symbol*⟩`]{`⟨*text*⟩`}` can be used in the new pagestyle definition to add something to the footer. The optional argument expects the symbol to be used as a separator between elements that appear on the same line. If it is omitted `\fsymbol` is used.

`\addtofooter`

`\fsymbol` For a redefinition of `\fsymbol` use `\renewcommand*\fsymbol{`⟨*symbol*⟩`}`, *for example:* `\renewcommand*\fsymbol{~\textbullet~}`.

3.3 Symbols

`\addresssymbol`
`\phonesymbol`
`\mobilesymbol`
`\faxsymbol`
`\emailsymbol`
`\homepagesymbol`
`\twittersymbol`
`\githubsymbol`
`\facebooksymbol`
`\linkedinsymbol`
`\listitemsymbol`

You can change (or set) the symbols (or the string) used before the phone, fax and mobile number, the e-mail address and the homepage with the according macros (see beside) and `\renewcommand`, e. g.
`\renewcommand\phonesymbol{Tel.~}`

In the same way the item symbol in the listitems may be changed with the macro `\listitemsymbol`.

3.4 Picture

`\photo`
`[frame]`
`[mframe]`
`<width>`
`<path/pic>`

To include a picture into the head of your CV set
`\photo[`⟨*frame*⟩`]{`⟨*width*⟩`}{`⟨*path/pic*⟩`}`
in the preamble.

With `frame` as optional argument the picture is set into a frame, by default in the color chosen as document color. See below (3.5, 3.6) how to change the color and the thickness of the frame.

With the `classic` style, `[mframe]` (for margin frame) will extend the picture into the right page margin with half its width (or according to the length of `\mframepicshift`, if defined). With other styles `[mframe]` is an alias for `[frame]`.

The first mandatory argument takes the width the picture is resized to, all common LaTeX measures may be used.

The second mandatory argument takes the name of the picture file. If the picture is not located in the same directory as the document and no `\graphicspath` was defined, the path to the picture file must be given as well. This argument will be passed to the graphicx package, so all file types that graphicx can handle are allowed (jpg/jpeg, png, pdf).

3.5 Lengths

The following lengths may be changed with the usual LaTeX commands `\setlength`, `\addtolength` and `\settowidth`.

`\hintscolwidth`
The width of the hint column. The default value is `0.2\textwidth`.

`\sepcolwidth`
The distance between the hint column and the main column. In `\cvdoubleitem` and `\cvlistdoubleitem` this is also the distance between the aligned items, or the aligned pairs of header and item.

`\infocolwidth`
In `oldstyle` style the address and possible extra information are presented in the left margin of the width `\infocolwidth`. Its default value is `3.5cm`.

`\sepinfocolwidth`
In `oldstyle` style the distance between the info column and the main column.

`\maincolwidth`
The width of the main column in all elements, except for the `doubleitem` elements.

`\dbitemmaincolwidth`
Width of each maincolumn where two items are set per line with `\cvdoubleitem`.

`\listitemsymbolwidth`
Horizontal space reserved for the symbol in `\listitem` entries. By default this is the width of `\listitemsymbol` followed by a nonbreaking space (`~`).

`\listitemmaincolwidth`
Width of the maincolumn where `\cvlistitem` is in use. By default this is the `\maincolumnwidth` minus `\listitemsymbolwidth`.

`\listdbitemmaincolwidth` Width of each maincolumn where two items are set per line with `\cvlistdoubleitem`.

`\titlesepwidth` Horizontal space between the text information given in the header and the picture (if `\photo` is set).

`\mframepicshift` If a picture is set with the optional argument `[mframe]` of `\photo` the picture will be placed partly in the margin. The length `\mframepicshift` controls how much the picture will be moved to the right (from the right text margin). This works only with the `classic` style; with other styles `\mframepicshift` does nothing.

`\fboxrule` `\fboxsep` The thickness of the frame around your picture and the space between the frame and the picture (if `\photo` is set with either `[frame]` or `[mframe]` as optional argument).

`\quotewidth` The width of the quote.

`\footerwidth` The width of the footer (used in `casual` style).

`\aftertitlevspace` Vertical space between head and quote (or main text, if no quote is given).

`\afterquotevspace` Vertical space between quote and main text. Used only if quote is given.

`\afterelementsvspace` Vertical space inserted after each element (`\cvitem`, `\cventry`, …).

`\beforesecvspace` `\aftersecvspace` `\beforesubsecvspace` `\aftersubsecvspace` Vertical space inserted before or after sections and subsections. Use an elastic length (e. g. something like `3ex plus .2ex minus .1ex` or `\baselineskip`). Note that the section and subsection definition of komacv needs improvement, so the setting of these lengths may not procuce the desired result and the result may change in future versions.

3.6 Colors

`\colorlet` The color theme of the whole document is changed via the documentclass options as described above (3.1). If you want to change the color of certain elements only you may do so with the command

`\colorlet{`⟨*elementcolorname*⟩`}{`⟨*color*⟩`}`, *for example*

`\colorlet{firstnamecolor}{red}` (basic color name) *or*

`\colorlet{firstnamecolor}{Firebrick2}` (color name as defined in the color spectrum specified with the documentclass option `[`⟨*xcolor*= ⟩`]`, x11names in this case) *or*

`\colorlet{sectitlecolor}{firstnamecolor}` (make the sectiontitles have the same color as the firstname).

`firstnamecolor` `familynamecolor` `acadtitlecolor` `addresscolor` `quotecolor` With the colornames given beside you can change the color of the corresponding elements that are used in the head (or foot) of your CV. By default (i. e. if you do not change the colors with `\colorlet`) the text in the CV head is black. More precisely, the firstnamecolor is black, the other elements of the head take the color of the firstname. So if you want to change the color of the whole text in the head, it suffices to change `firstnamecolor`. If you want the different elements to have different colors, you have to define them separately.

`framecolor` `framebackcolor` `framecolor` and `framebackcolor` may be specified when `\photo` is used with either `[frame]` or `[mframe]` as optional argument. `framecolor` sets the color of the frame around the picture, `framebackcolor` of the interspace between frame and picture. By default `framecolor` is the color of the document colortheme, `framebackcolor` is white.

`secbarcolor` `seccolor` `subseccolor` By default the section headers, the bar beside the section headers (if provided by the current style) and the subsection headers are given in the

color of the document colortheme. To change the settings use the colornames given beside.

hintcolor

`hintcolor` is the name of the color used for the text in the hint column. By default it is black.

\definecolor

If you want to assign a color to a name you can do so with the `\definecolor` command from the xcolor:

mycolor

`\definecolor{mycolor}{cmyk}{0.92,0,0.87,0.09}`.

This new (or any other) name may be given as value to the `color` key in the documentclass optionlist and used with `\colorlet` as just described.

3.7 Encoding and Fonts

This class does not load any fonts. The different enginges have their own ways of handling fonts and it is up to the user to choose the enginge and a font suitable for the style in use. With XeTeX, XeLaTeX, LuaTeX and LuaLaTeX `fontspec` is loaded by `komacv`, with pdfLaTeX utf8 is loaded as input encoding and T1 as fontencoding. Set the desired font in a usual enginge-specific way, e. g. with `\setmainfont{`⟨*font*⟩`}` for XeTeX, LuaTeX and friends and with `\usepackage{`⟨*font*⟩`}` for pdfLaTeX.

The element specific font attributes are set with `\newkomafont` and may be adjusted with `\setkomafont` or `\addtokomafont`.

For example:

firstnamefont
familynamefont
acadtitlefont
addressfont
quotefont
hintfont
commentfont
commentmainfont
linkfont
httplinkfont
emaillinkfont
section
subsection

`\setkomafont{firstnamefont}{\fontsize{24}{26}\itshape}` *or*
`\addtokomafont{familynamefont}{\scshape}` *or*
`\setkomafont{addressfont}{\usekomafont{quotefont}}`.

By default `familynamefont` is the same as `firstnamefont`, so if you want to change both it suffices to change `firstnamefont`. `addressfont` is used for the whole addressblock, including address, phone and fax numbers, email address, homepage address and extrainfo.
`commentfont` and `commentmainfont` are used in `\cvitemwithcomment` only.

`linkfont`, `httplinkfont`, `httpslinkfont`, `emaillinkfont` are used for the link commands `\link`, `\httplink`, `\httpslink`, and `\emaillink` (described below 4.8).

Font attributes of elements that belong to the scrartcl class are also changed in the usual KOMA-way, e. g.:

`\setkomafont{section}{\Large\sffamily\mdseries\slshape}`.
`\addtokomafont{subsection}{\bfseries}`.

Switching to a sans-serif font as default is done in the usual LaTeX way, e. g.

```
\renewcommand\familydefault{\rmdefault}\normalfont
```

at the beginning of the document (not in the preamble!) This will change the font of some elements, though not all. Make use of the font definition macros for everything else.

3.8 Page number

\totalpagemark

The command `\totalpagemark` prints the total number of pages. With the following definition in your preamble you will get the page number followed

by a slash and the total number of pages in the outer foot of your pages (with the help of scrlayer-scrpage which is loaded by the documentclass):

```
\pagestyle{scrheadings}
\clearpairofpagestyles
\ofoot{\pagemark/\totalpagemark}
```

3.9 Hypersetup

\hypersetup

To change the way hyperlinks are highlighted in the pdf document, use the `\hypersetup` command. This command is provided by the hyperref package which is loaded by the komacv class. See the hyperref manual for the options available. Example: use `\hypersetup{pdfborder = false}` to remove the box around links in the pdf-document.

pdfauthor
pdftitle
pdfsubject
pdfkeywords
allbordercolors
citebordercolor
filebordercolor
linkbordercolor
menubordercolor
urlbordercolor
runbordercolor

Note: The following `\hypersetup` option keys (and these only) must *not* be redefined with `\hypersetup` but with `\renewcommand`: `pdfauthor`, `pdftitle`, `pdfsubject`, `pdfkeywords` and all `…bordercolor` options. *For example*, do not use:

`\hypersetup{pdftitle = {My~CV}}` but rather:

`\renewcommand*\pdftitle{My~CV}`.

This is necessary because the defaults defined by the documentclass are loaded at the end of the preamble and would overwrite any user settings.

All `\hypersetup` color options accept the same color names as does the documentclass `color` option (i. e. it depends on the setting of the documentclass option `xcolor` which names will be recognized). So you can change the color options like this:

`\renewcommand*\urlbordercolor{green}` (for the `…bordercolor` options), but

urlcolor

`\hypersetup{urlcolor=pink}` (for all other `…color` options).

4 In the document

4.1 `\maketitle`

\maketitle

With `\maketitle` at the beginning of your document your personal data and your picture as specified in the preamble will be set in the header (and possibly footer) of the first page according to the chosen style.

If you want the footer to appear on all pages, use `\pagestyle{footer}` or `\pagestyle{`⟨*mypagestyle*⟩`}` somewhere at the beginning of your document (not in the preamble).

4.2 Sections and subsections

To structure your CV into sections like “Education”, “Job training”, “Interests” a.s.o. use the `\section` and `\subsection` commands. They are formatted according to the current style and include no section numbering. See above (3.6 and 3.7) how to change the color and the font attributes of sections and subsections.

4.3 \cvitem

\cvitem

\cvitem[⟨*spacing*⟩]{⟨*header*⟩}{⟨*text*⟩} is for single pairs of header and text. The header will appear in the hint column, the main text in the main column.

The optional argument defines the vertical space after this \cvitem element. This applies analogously to all the elements with an optional spacing argument.

To change the vertical space used after *all* \cv… elements that have an optional spacing argument, change \afterelementsvspace as desribed above (3.5). If the optional spacing argument is used it overrides the value of \afterelementsvspace for the current element.

Caveat: No newlines (\\) or paragraphs (\par oder empty lines) are allowed inside \cvitem and the other predefined elements. They will lead to an error message like:

```
! Paragraph ended before \cvitem was complete.
```

and the parsing process will stop.

4.4 \cvdoubleitem

\cvdoubleitem

\cvdoubleitem[⟨*spacing*⟩]{⟨*header1*⟩}{⟨*text1*⟩}{⟨*header2*⟩}{⟨*text2*⟩} puts two pairs of header and text in one line. The first header appears in the hint column.

4.5 \cvlistitem and \cvlistdoubleitem

\cvlistitem[⟨*label*⟩]{⟨*item*⟩} and
\cvlistdoubleitem[⟨*label*⟩]{⟨*item1*⟩}{⟨*item2*⟩}
put one or two pair(s) of label and item in the main column. The hint column is left empty. If the optional argument is omitted, the label is the default label provided by the style in use or the label defined with \listitemsymbol.

4.6 \cventry

\cventry

With the command
\cventry[⟨*spacing*⟩]{⟨*years*⟩}{⟨*degree/job title*⟩}{⟨*institution/employer*⟩}
{⟨*localization*⟩}{⟨*grade/...*⟩}{⟨*comment/job description*⟩}
you get a more structured description. The first mandatory argument will usually be placed in the hint column (depending on the style in use), all others in the main column, each with its own formatting. Just leave empty those arguments you do not need (use empty braces {}) . Note, however, that the second mandatory argument should not be empty (otherwise the entry in the main column will start with a comma). In case the predefined formatting of the arguments does not suit your needs you may of course use formatting commands inside the arguments.

4.7 \cvitemwithcomment

\cvitemwithcomment

With \cvitemwithcomment[⟨*spacing*⟩]{⟨*header*⟩}{⟨*text*⟩}{⟨*comment*⟩} you can list a pair of header and description with a additional right-aligned comment.

4.8 Links

There are four link commands predefined:

\link `\link[`⟨*optional text*⟩`]{`⟨*link*⟩`}`,

\httplink `\httplink[`⟨*optional text*⟩`]{`⟨*link*⟩`}`, and

\httpslink `\httpslink[`⟨*optional text*⟩`]{`⟨*link*⟩`}`, and

\emaillink `\emaillink[`⟨*optional text*⟩`]{`⟨*link*⟩`}`.

All of them take a description as optional argument and the link address as mandatory argument. The optional argument will be shown in the text, the hyperlink points to the address given in the mandatory argument. If no optional argument is given the address in the mandatory argument will be printed. The mandatory argument of `\httplink` will be prefixed with `http://`, of `\httpslink` with `https://`, of `\emaillink` with `mailto:`. To change the font attributes of the links, see above 3.7.

4.9 Itemize

compactitem
compactenum
compactdesc

These are three compact versions of the standard lists `itemize`, `enumerate` and `description` (by the enumitem package). In the default setting within komacv they come without indentation or extra spacing so they fit nicely into other elements such as `\cvitem`. They are used in the usual way:

`\begin{compactitem}`
`\item` ⟨*text*⟩
`\end{compactitem}`.

If you use them inside other elements make sure there are no empty lines surrounding them, otherwise you will get an error message (see 4.3).

5 Styles

5.1 The `classic` style

In `classic` style all personal data appear in the header with the optional picture on the right side. Section and subsection headers are given in the document color and placed in the main column. On the left side of the section headers is a horizontal bar in the hint column.

5.2 The `casual` style

The `casual` style is built upon the `classic` style with a few changes. The main difference to the `classic` style is that the picture is set at the left of the header and the address block is set in the foot of the page. By default the foot is set on the first page only. If you want it on all pages, put `\pagestyle{footer}` at the beginning of your document.

5.3 The `oldstyle` style

This style provides a CV with the addressblock in the left margin and the hint column to the right. The section headers are kept simple, without section bars. To allow for three columns the `DIV` value is increased.

6 Examples

For examples see the example files `komacv_example_`⟨*style*⟩`.pdf` that come with this class. They should be located in the `doc`-directory of the tree where the class is stored. The example file `komacv_example.tex` can be used to test the various possibilities `komacv` offers. Just remove (or add) comment signs and play around.

7 New CV styles

The flexibility of komacv makes it fairly easy to create new CV styles. If you have created a CV style of your own and want to share it with others you have several possibilites:

You can publish it on CTAN. Just make sure it will be installed in the `styles`-subdirectory of the `komacv`-directory
(such as `tex/latex/komacv/styles`).

Or you can put it on GitHub (`salsod/komacv`) or send it to me by e-mail (`salome.soedergran@gmx.ch`) and I will include it in the next version of komacv.

For your personal use, you can put it either into the working directory of your .tex-file (your cv-file) or into your local texmf-tree. In the latter case, don't forget to run texhash on the directory to refresh your tex system.

8 Bugs, feature requests, and maintenance

Known issue: Inconsistent vertical space between multiline cvlistitems (`\cvlistitem`).

Feature request: A feature that has sometimes been asked for is the possibility of creating a cover letter based on komacv for a job application. This has not been implemented into komacv so far. The KOMA-Script now offers the possibility to create letters not only with the letter class scrlttr2, but also to load the package scrletter within any KOMA-class. This works also for komacv. If you're interested in creating a cover letter inside komacv, also have a look at Richard Grewe's extra package `komacv-rg` (see below, Acknowledgements).

Further testing and use will certainly make some bugs crawl out from the dark in which they hide from me until now. If you encounter bugs, errors or typos, or if you have suggestions how to improve the komacv class and the style files, please do not hesitate to contact me (in English or German) at `salome.soedergran@gmx.ch`. I am thankful for any suggestions that help improving komacv though I dare not promise to be always very speedy in publishing a new version. Computer stuff is something of rather low priority with me. So if you make a point of having bugs fixed as soon as possible please consider making your own contributions on GitHub (`salsod/komacv`) …or to become the new maintainer of komacv.

9 Acknowledgements

Many thanks to Richard Grewe, Samuel W. Flint, Alexander Dietzel, Ulrike Fischer, Alexander Kränzlein, Matthias C. Schmidt, Damian Martinez Dreyer, Wolfgang Witt, and Sebastian Röder for their suggestions and help. I am also grateful to Andreas Bießmann, Simon Dreher, Paul Menzel and Dominik Waßenhoven who helped to improve the (now obsolete) `koma-moderncvclassic.sty`.

On CTAN you can find the bundle komacv-rg by Richard Grewe with extra features: "The komacv-rg bundle provides packages that aid in creating CVs based on the komacv class and creating related documents, such as cover letters and cover sheets for job applications. Concretely, the bundle consists of three packages: komacv-addons, komacv-lco, and komacv-multilang." (The bug fixes presented in komacv-addons v0.9.2 found their way into komacv as of v1.1.2.) Many thanks for this great addition!

10 Implementation

Note: The code of the styles is not part of the file `komacv.cls` but is to be found in the style files `komacv-`⟨*stylename*⟩`.sty`, e. g. `komacv-classic.sty`.

Change History

v1.0
General: Initial version 1
v1.0.1
General: Installation problem fixed 1
v1.1
\headline: Default font size changed, due to new font headlinefont 4
New macro headline, and new correspondent elements headlinestyle, headlinecolor, headlinefont 4
General: \usefontofkomafont instead of \usekomafont, avoiding unintended side effects 14
Added macros and symbols for social media 18
Definition of \section and \subsection changed, mainly to avoid pagebreaks (all styles) 29
Lengths \beforesecvspace, \aftersecvspace, \beforesubsecvspace and \aftersubsecvspace added to \section and \subsection definitions 25
Linebreaks (hyphenation and no justificaton in narrow lines) improved with ragged2e. 12
New user length \titlenamemaxwidth 14
Option headline added; user length titlenamemaxwidth; behavior of sections and subsections improved; several bugfixes 1
scrlayer-scrpage instead of the obsolete scrpage2 12
Vertical space between name and academic title adjusted 21
v1.1.1
General: Typos in the documentation and minor bugs fixed 1
v1.1.2
\headline: Improved implementation of headline. Caution changed syntax 4
General: \httpslink added. 10
Improved implementation of headline, minor bug fixes, httpslink added, fontawesome-switch added 1
New implementation 21

Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
